A NEW DAWN FOR

SMART HOME AI

The Efficiency-Adaptive Home

One place. One context.
An experience that follows the day.

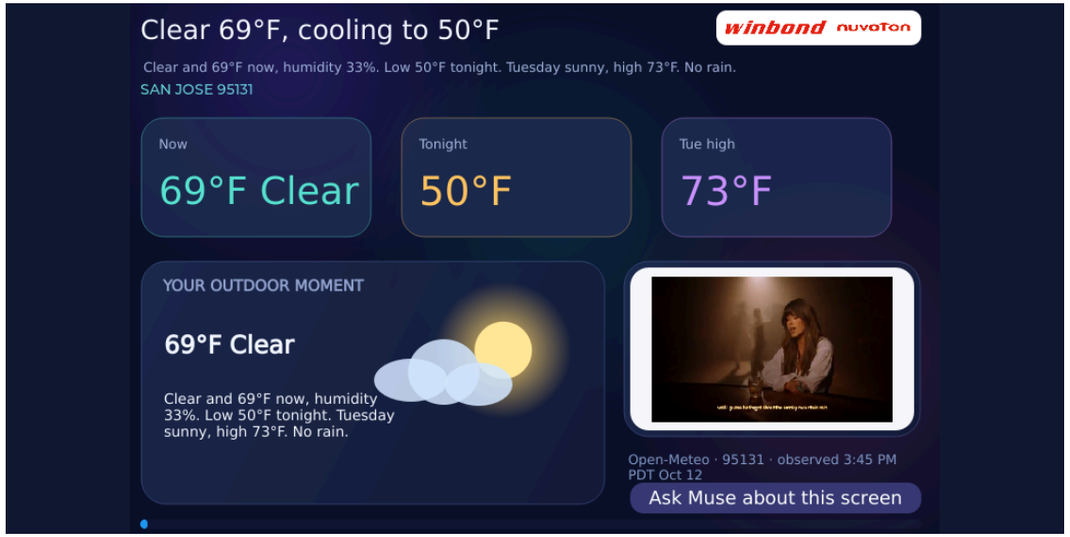

LIVE MA35 BOARD • HOME + MEDIA + FIVE-BAND EQ

A HOME IN SYNC WITH YOU.

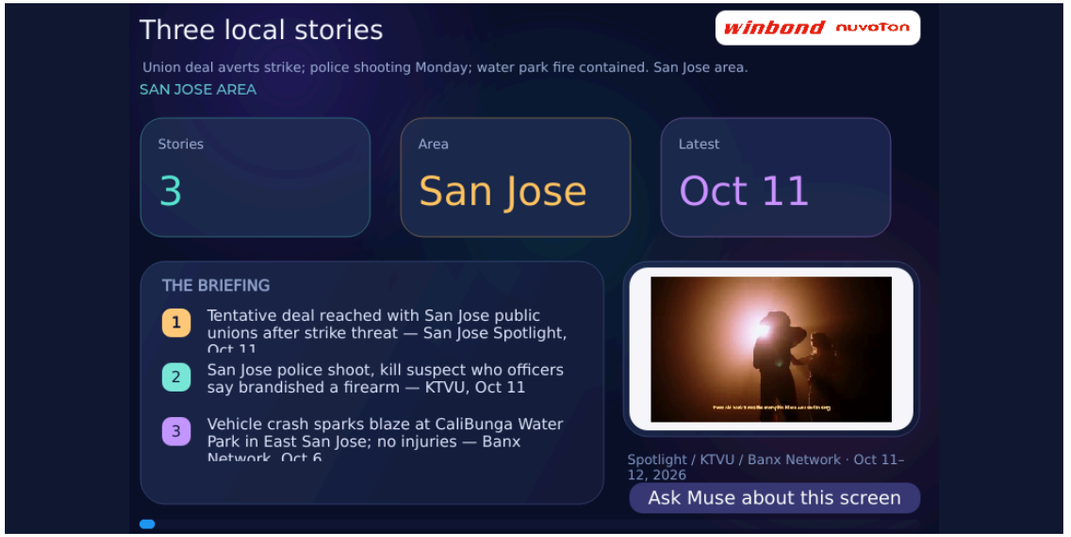

One change. A whole home in sync.

Tell Muse a new zip code. The home resolves its place and time zone, then refreshes local weather, regional news, air estimates and every dependent recommendation against one versioned context.

Local date, season, daylight and time of day connect the panels. Home turns them into a daily briefing. Sources, timestamps and missing inputs stay visible throughout the experience.

WEATHER / LOCAL FORECAST + SOURCE + ZIP

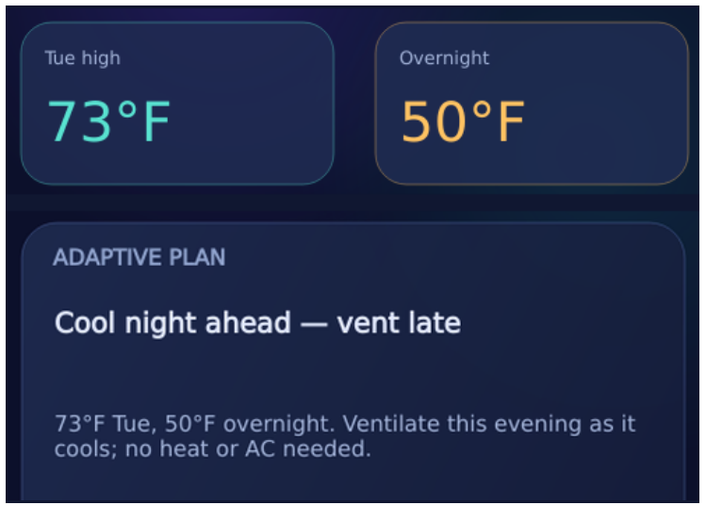

NEWS / REGIONAL STORIES + PUBLICATION CONTEXT

95131 → resolve place → fetch sources → evaluate → publish one revision

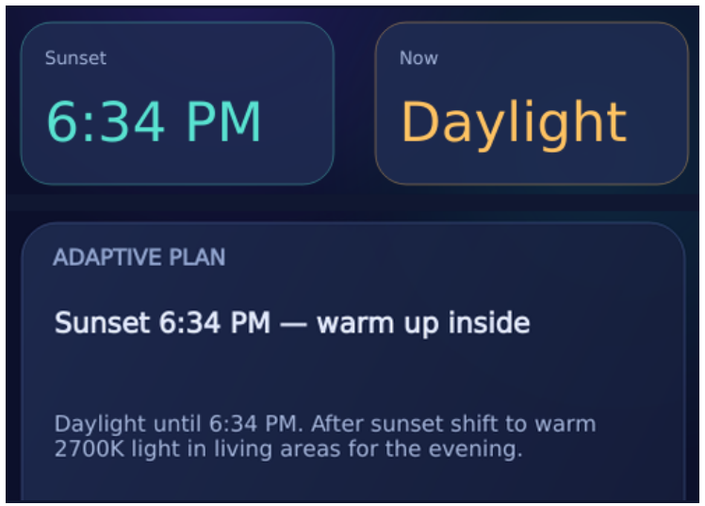

Let the day set the rhythm.

Weather, date, season and daylight are shared inputs. The framework uses them together to explain comfort choices, warm the evening lighting plan and coordinate whole-home energy guidance.

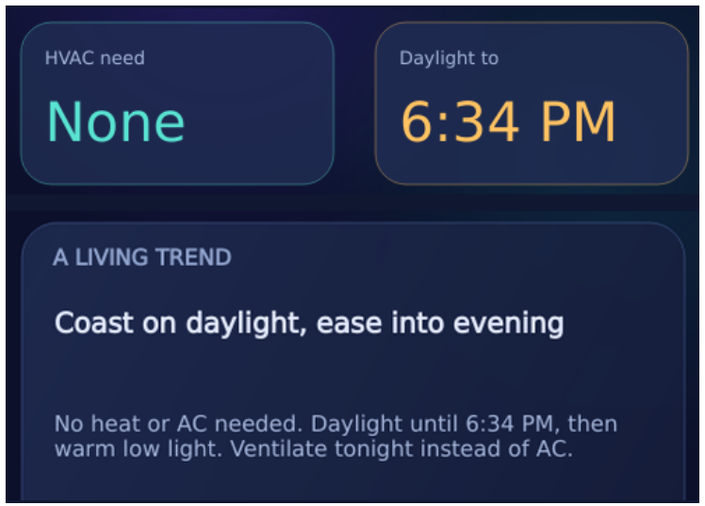

COMFORT

A cooler night can support ventilation advice. Indoor readings and a thermostat adapter are the next integration.

LIGHTING

Local sunset anchors the transition from daylight to warmer evening scenes, with household preferences retained.

ENERGY

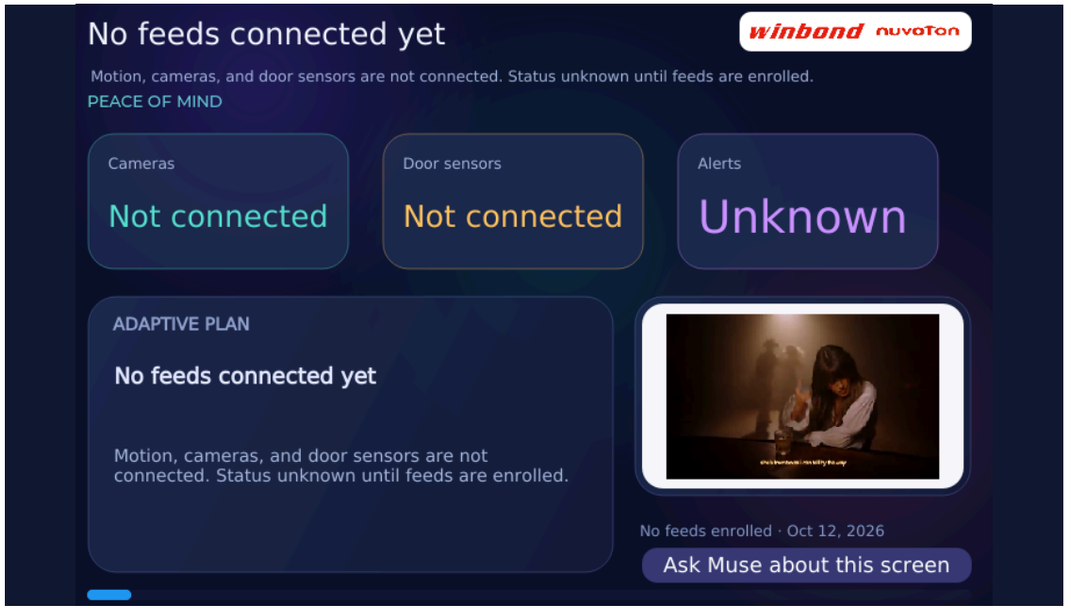

Climate and lighting contribute to one strategy. Meter, tariff and measured savings are not connected in this prototype.

A clear view of what the home knows.

AIR QUALITY WITH PROVENANCE

The captured AQI and PM2.5 values are model estimates for outdoor conditions. A future purifier adapter can use fresh inputs and bounded on/off thresholds; no purifier is connected here.

SECURITY THAT SAYS WHAT IS MISSING

Motion, cameras, people and doors belong in one view. This capture correctly says the feeds are unconnected. Face identification requires enrollment; physical access needs a separate authenticated decision.

Your day. Remixed.

Home brings the specialist panels together with favorite media: family slideshows, local video, radio, Muse answers and picture-rich PDF reports.

RADIO

Chosen music

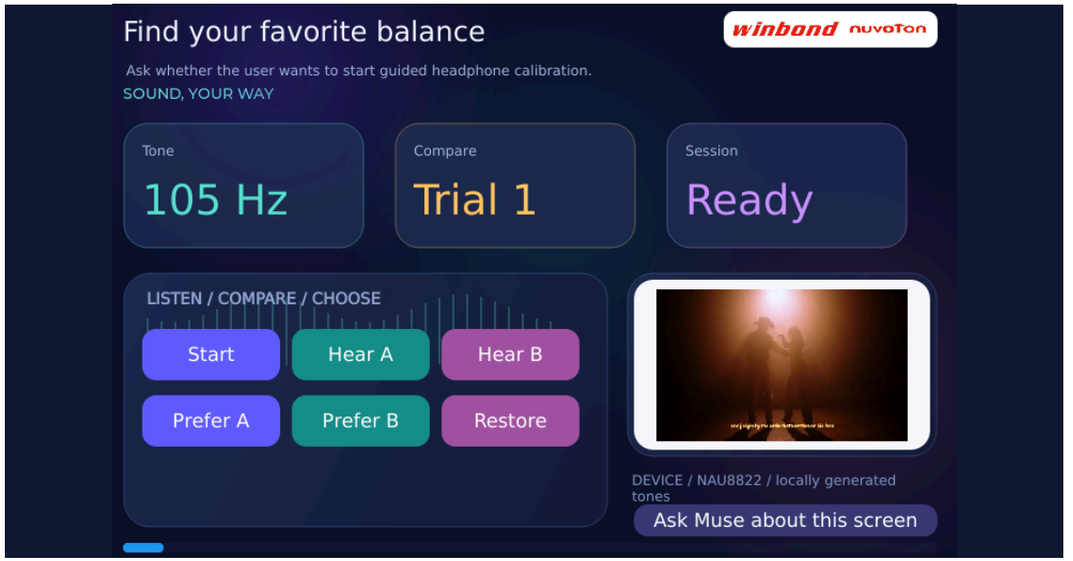

Larger media on the left. Real five-band EQ and volume on the right.

Make the routine yours.

SCENES / THE EVENING, REMIXED

A routine combines forecast, lighting and comfort context. It remains a proposal until a resident or an authorized rule executes it. Missing feed items remain visibly unsupplied.

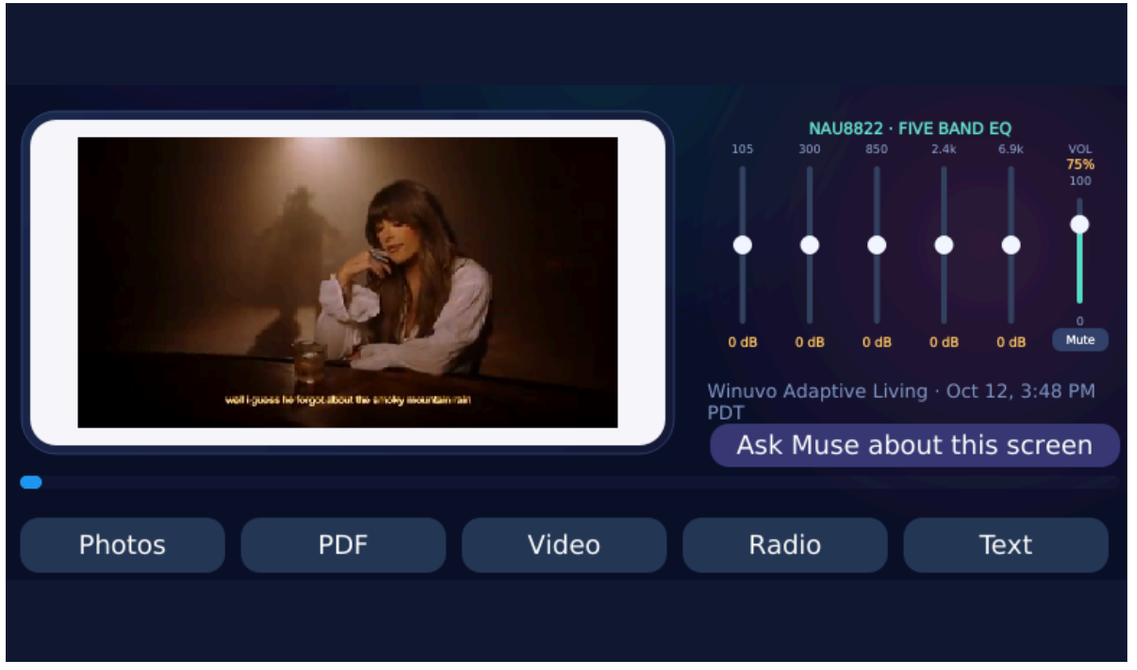

SOUND LAB / MUSE ASKS, YOU CHOOSE

Compare generated tones and choose the preferred sound. Five NAU8822 hardware EQ bands tune the listening profile. Keep the result or restore the starting sound; volume remains a separate control.

One XML. Qt and LVGL, together.

A shared XML definition drives the LVGL base and a transparent Qt overlay. Coordinates, bindings and navigation line up across the two layers. Typed APIs supply current content and accepted actions.

The UI is part of the contract: a changed slider must immediately repaint its thumb and label, then reflect the resulting hardware state. AI content does not need low-level graphics or codec-register access.

DETAIL CROP / MEDIA + VERTICAL EQ + VOLUME

XML

Composition + bindings

LVGL + QT

Aligned rendering layers

TYPED API

Bounded data + actions

One revision. Every dependent panel.

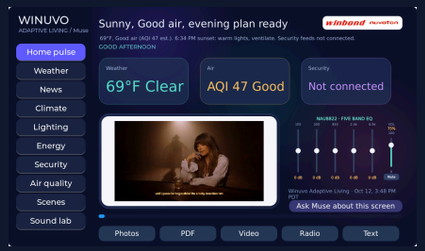

RESOLVE	FETCH	VALIDATE	EVALUATE	PUBLISH	EXPLAIN

adaptive.context	Read context, sources, freshness and revision.
adaptive.configure	Set a validated zip code, time zone and bounded policies.
adaptive.update	Accept sourced weather, air and news inputs.
adaptive.evaluate	Return recommendations with reasons; no actuation claim.
adaptive.publish	Bind all panel models to the current location revision.
adaptive.refresh	Ask Muse to refresh the dependent templates together.
adaptive.report	Generate the dated, picture-rich daily PDF.

A zip change invalidates old local inputs. Late publications for the previous revision are rejected.

A home that can show its work.

Daily reports bind the narrative and pictures to the same place, date, time zone and context revision. Delivery can include pictures and a PDF when an installed phone or messaging adapter supports attachments.

TEN ACTUAL BOARD CAPTURES / UI EVIDENCE, WITH ESTIMATE AND CONNECTIVITY LABELS

Build trust into the shared context.

KNOWN, ESTIMATED, SOURCED, UNKNOWN

Every input retains its basis, source and timestamp. The prototype marks weather and air stale after two hours and news after one day. These are configurable demonstration defaults. An absent adapter remains “not connected”; a recommendation remains “proposed” until actual execution is confirmed.

MEASURE BEFORE CLAIMING

Evaluate coherent refresh time after a zip change, rejection of stale revisions, source comprehension and touch response. Check comfort against indoor measurements, device actions against feedback, and energy use against a measured baseline and real tariff.

The architectural claim

A shared, provenance-aware context can coordinate useful home experiences through bounded operations. The MA35D1 demonstrator establishes the UI and API framework; household sensors and adapters complete the system.

AI expresses intent through named operations. Credentials, updates, auditing, recovery and household consent remain product engineering responsibilities.

From a visible prototype to a living home.

Demonstrated: ten live XML-defined views, a Qt/LVGL composition, local media, PDF presentation, generated listening tones and five-band codec controls. Captured on 12 October 2026 with zip context 95131. Crops in this prospectus preserve the original display content.

Next integrations: indoor sensors, a thermostat and purifier adapter, lighting feedback, enrolled motion/camera/door feeds, energy meters and tariffs. Device actions must be authorized, observable and recoverable. No energy savings, connected security feeds or room measurements are claimed by these captures.
